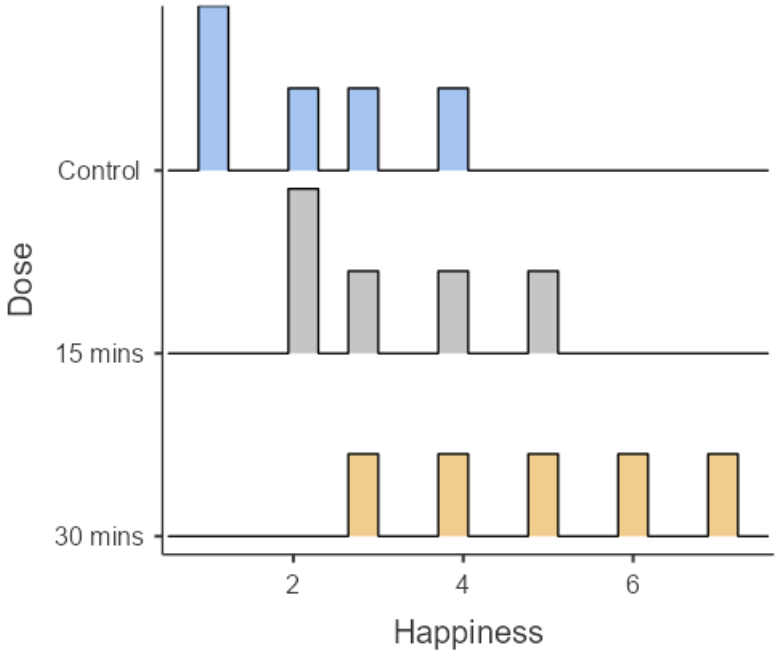
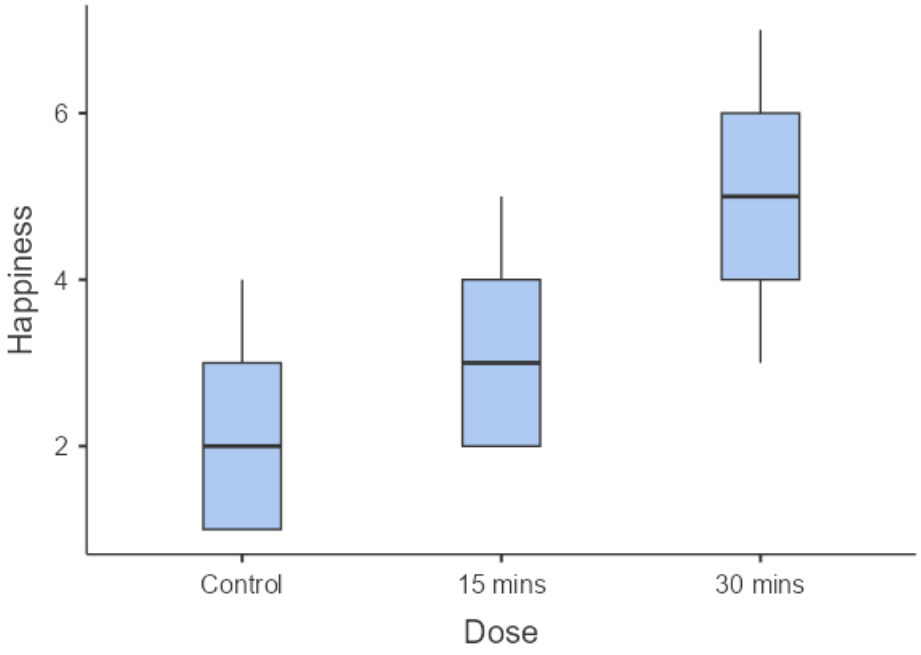
Plots

Happiness





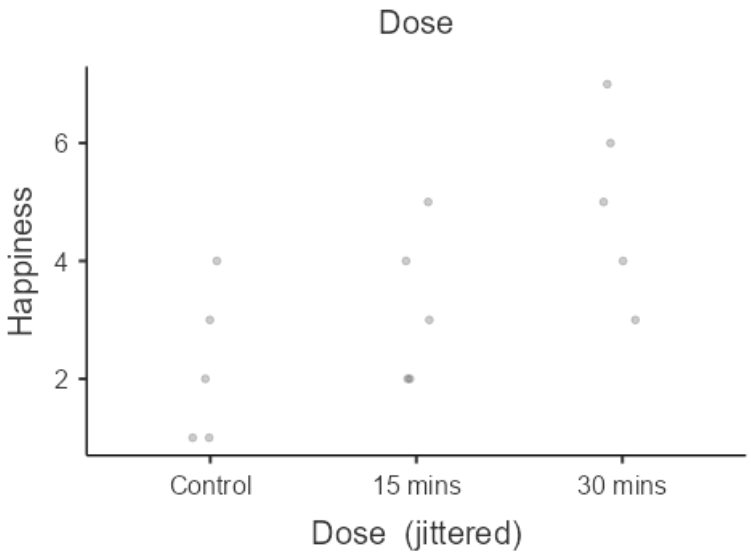
Relationships, Prediction, and Group Comparisons

You have entered a numeric variable for Variable 1 / Dependent Variable and a nominal variable for Variable 2 / Independent Variables. Hence, a one way ANOVA, which is is a test for the difference between several population means, seems to be a good option for you! In order to run this analysis in jamovi, go to: ANOVA > ANOVA

- Drop your dependent (numeric) variable in the box below Dependent Variable and your independent (grouping) variable in the box below Fixed Factors

If the normality or homoscedasticity assumption is violated, you could use the non-parametric Kruskal-Wallis test. Click on the links to learn more about these tests!

Scatter Plots of Bivariate Relationships - Dependent/Independent Variables



One-Way ANOVA

One-Way ANOVA

		F	df1	df2	p
Happiness	**Welch's**	4.32	2	7.94	0.054
	Fisher's	5.12	2	12	0.025

Group Descriptives

	Dose	N	Mean	SD	SE
Happiness	**Control**	5	2.20	1.30	0.583
	15 mins	5	3.20	1.30	0.583
	30 mins	5	5.00	1.58	0.707

Assumption Checks

Homogeneity of Variances Tests

		Statistic	df	df2	p
Happiness	**Levene's**	0.0917	2	12	0.913
	Bartlett's	0.185	2		0.912

Note. Additional results provided by *moretests*

Normality Tests

		statistic	p
Happiness	**Shapiro-Wilk**	0.917	0.171
	Kolmogorov-Smirnov	0.179	0.720
	Anderson-Darling	0.517	0.159
